

AMENDMENTS TO THE CLAIMS

The following Listing of Claims replaces all prior versions, and listings, of claims.

LISTING OF CLAIMS

1- 43. (Cancelled).

44. (Currently Amended) A method for *in vitro* fertilization comprising the steps of:

a) recovering one or more oocytes from a female subject;
b) exposing and culturing *in vitro* one or more oocytes with spermatozoa in a culture medium containing an additive or additives capable of endogenous stimulation of the accumulation of at least one meiosis activating sterol (MAS), such that the oocytes progress to at least metaphase II (MII),
~~characterized in that the oocytes are in metaphase II (MII) and~~
wherein step (b) lasts at least the exposure and culturing lasting until zygotes and/or pre-embryos are formed and wherein the MII oocytes are cumulus enclosed oocytes.

45. (Previously Presented) The method according to claim 44, wherein 1-15 oocytes are cultured and exposed together.

46. (Previously Presented) The method according to claim 44, wherein the additive or additives leads to a ratio of at least 2 between the relative content of MAS in cumulus enclosed oocytes cultured in the presence of the additive or additives, the relative content of MAS in cultured cumulus enclosed oocytes being determined by stimulating female mice with exogenous gonadotropins 48h prior to removal of the ovaries from the mice and recovering cumulus enclosed oocytes from the ovaries by puncturing individual follicles and culturing the recovered cumulus enclosed oocytes in an α -minimum essential medium supplemented with 3mg/l bovine serum albumin, 5 mg/l human serum albumin, 2mM L-glutamin, 100IU/ml penicillin, 100 μ g/ml streptomycin, 4mM hypoxanthine and 3 H-mevalonate for 24h at 37°C, 100% humidity and 5% CO₂ in air, followed acidification with 50 μ l 0.3M Na₂PO₄ pH=1, organic extraction three times with a five-fold surplus of n-

heptane:isopropanol (3:1 v/v), purification of MAS from the organic phase by high pressure liquid chromatography and determination of the ratio of radioactivity per cumulus enclosed oocyte between cumulus enclosed oocytes cultured in the presence of the additive or additives and cumulus enclosed oocytes cultured without the presence of the additive or additives.

47. (Currently Amended) The method according to claim 44, wherein the additive is selected from the group consisting of: gonadotropins such as FSH (i.e., proteins with follicle stimulating activity comprising the amino acid sequences of the heterodimers of the FSH and the chains of pituitary derived proteins and substances activating the FSH receptor of the ovarian cumulus cells) and analogues, growth factors such as EGF (i.e., proteins which activate the EGF receptor and causes accumulation in the cumulus-oocyte complex) and analogues, compounds inhibiting sterol $\Delta 14$ -reductase such as AY9944 A-7, compounds inhibiting 4-demethylase converting T-MAS to Zymosterol, compounds activating cytochrome P450 lanosterol 14 α -demethylase and compounds with an amphotericin like effect.

48. (Previously Presented) The method according to claim 47, wherein the additive is a combination of a gonadotropin and a growth factor.

49. (Previously Presented) The method according to claim 48, wherein the additive is a combination of EGF and FSH.

50. (Previously Presented) The method according to claim 47, wherein the additive is EGF.

51. (Withdrawn) The method according to claim 47, wherein the additive is FSH.

52. (Withdrawn) The method according to claim 49, wherein FSH is an FSH isoform with an isoelectric point above 5.0.

53. (Withdrawn) The method according to claim 51, wherein FSH is an FSH isoform with an isoelectric point above 5.0.
54. (Withdrawn) The method according to claim 49, wherein the FSH is derived from naturally occurring FSH such as FSH extracted from urine, or from recombinant FSH.
55. (Withdrawn) The method according to claim 49, wherein the concentration of FSH is between 2 and 200IU FSH/l.
56. (Previously Presented) The method according to claim 50, wherein the concentration of EGF is between 1 and 10ng EGF/ml.
57. (Withdrawn) The method according to claim 46, wherein the additive is amphotericin.
58. (Withdrawn) The method according to claim 47, wherein the additive is amphotericin.
59. (Previously Presented) The method according to claim 44, wherein the *in vitro* fertilisation is *in vitro* fertilisation of human oocytes.
60. (New) The method according to claim 47, wherein the gonadotropin is follicle stimulating hormone (FSH) and analogues thereof.
61. (New) The method according to claim 47, wherein the growth factor is epidermal growth factor (EGF) and analogues thereof.

62. (New) The method according to claim 47, wherein the, compound inhibiting sterol $\Delta 14$ -reductase is AY9944-A-7.
